We will start doing backward elimination with p-value. In Model 3, we are going to use backward elimination to delete p-values less than 0.05.

I am going to do group elimination meaning, 0.9 p-value variables will be deleted first, and so on.

```
In [23]: # From above statsmodel summary, we can find many variables with more than 0.9  
p-value. We will delete them all  
encoded_x = encoded_x.drop(['YearBuilt_1950-1959', 'YearBuilt_1960-1969', 'Year  
Built_1970-1979', 'YearBuilt_2009', 'YearBuilt_Before 1939', 'HeatingFuel_Solar'  
], axis = 1)
```

```
In [25]: X = encoded_x
Y = data.iloc[:, 1:2]
## fit a OLS model with intercept on TV and Radio
X = sm.add_constant(X)
est = sm.OLS(Y, X).fit()

est.summary()
```

As we see, we could not improve our score, meaning we have to clean the data and use assumptions of Multiple Regression to take out variables before modelling.
